

OPEN SOURCE · LOCAL-FIRST

OpenMausBot

A desktop app that turns AI agents into a messaging-app of bots — each one a contact with its own personality, model, memory, and tools, running on your own machine.

THE CORE IDEA

Bots as contacts, not a single chat window

Instead of one assistant, your sidebar holds many live agents — each a persistent thread with its own model, instructions, and permissions, the way contacts work in a messaging app.

Pick a brain per bot

Separate memory per bot

Independent tool access

Auto-routes unaddressed messages

UNDER THE HOOD

Architecture

UI

React + Vite + Tailwind chat interface — the sidebar of bots and conversation threads

SERVER

Harness on `127.0.0.1:8799` — manages agent processes, normalizes every provider into one event stream, brokers permissions

AGENTS

Local **Claude**, **Codex**, or **Grok** CLIs actually power each bot's reasoning

Frontend and server talk over HTTP commands + Server-Sent Events — all local, nothing routed through a third-party cloud.

WHAT IT SHIPS WITH

Key features

Computer access

Isolated cloud desktops or local VM/Xorg access with live screen previews per bot.

Approval workflows

Shell commands and file edits surface as inline cards — allow, deny, or respond.

500+ app integrations

One-click OAuth via Composio — Gmail, Slack, GitHub, Notion, and more.

Portable teams

Export a whole bot roster as Markdown; import someone else's team in one click.

Channels

Separate Work / Personal / project contexts, each with its own bot roster.

Voice

Bots read replies aloud via ElevenLabs, Fish Audio, Grok, or macOS voices.

SIMPLE EXAMPLE

A routine fires a bot

DESIGN PHILOSOPHY

Why it's built this way

Local-first

Transcripts, keys, and events live in `~/.openmausbot` — no cloud intermediary owns agent state.

Provider abstraction

One small interface (`server/contracts.ts`) — a new model provider plugs in as a single driver file.

Graceful degradation

An unavailable provider just marks itself "unavailable" instead of crashing the whole fleet.

Open license

Apache 2.0 core, no cryptocurrency affiliation, source-available enterprise edition.

Many specialized bots, each with their own brain and memory, living in one local, inspectable system — that's **OpenMausBot**.
